AI Chatbot for PRG 200 Using RAG (Retrieval-Augmented Generation)

Introduction

We are creating a chatbot for our PRG 200 class, where a student would be able to ask a question related to our course or class and our chatbot would answer the question. We will be using RAG and Gemini API to help run our chatbot.

Tools Used:

We will be using python as our main language to build the chatbot. We will be also using Google Gemini to power our chatbot using the Gemini API. For data we have created a prg_note.txt file which contains all the information about the course and class. We will be using RAG for hallucination problems as well as for our chatbot to answer the questions related to class. And for UI we will be using Tkinter. We will use a database to store the chat history.

Week 5 Progress:

This week we are creating a text file where all the information and data related to class will be present. Along with that we will be dividing the work between the Group.

Team Role:

Riwaj will be taking the lead for the project, where he will be working on the Chat bot using RAG. Kaustuv will be responsible for the UI and Sambrash will look over the database for the chat history.

What's Next:

Next week we will be making a simple working chatbot. And based on that we will build the chat bot further.
